

Note:

$$D(\epsilon_F) = \frac{3}{2} \frac{n}{\epsilon_F} = \frac{m k_F}{\hbar^2 \pi^2}$$

$$D(\epsilon) = D(\epsilon_F) \sqrt{\frac{\epsilon}{\epsilon_F}}$$

### Quantum Free $\bar{e}$ (Sommerfeld) @ finite temperatures

→ moving to  $T > 0$  means  $\bar{e}$  will fill our single  $\bar{e}$  allowed states in a slightly different manner

Grand canonical ensemble:

→ expected single-state occupancy  $\langle N_i \rangle \Rightarrow (f(\epsilon_k))$

$$\langle N_i \rangle = k_B T \frac{1}{Z} \left( \frac{\partial Z}{\partial \mu} \right)_{V, T}$$

$\mu \rightarrow$  chemical potential

$Z \rightarrow$  partition function

For any state (allowed  $k$ ) the partition function is given by a sum over all allowed occupancies  $(N_i)$ : i.e. microstates.

$$Z = \sum_i e^{(N_i \mu - E_i)/k_B T}$$

For  $e^-$ 's (Fermions), there are only two microstates:

$$N_i = 0, \quad \therefore E_i = 0$$

$$N_i = 1, \quad \therefore E_i = \epsilon_i$$

$$\therefore Z = e^0 + e^{(\mu - \epsilon_i)/k_B T}$$

$$Z = 1 + \exp[(\mu - \epsilon_i)/k_B T]$$

$\therefore$  for state  $i$ :

$$\langle N_i \rangle = k_B T \left( \frac{1}{1 + \exp[(\mu - \epsilon_i)/k_B T]} \right)$$

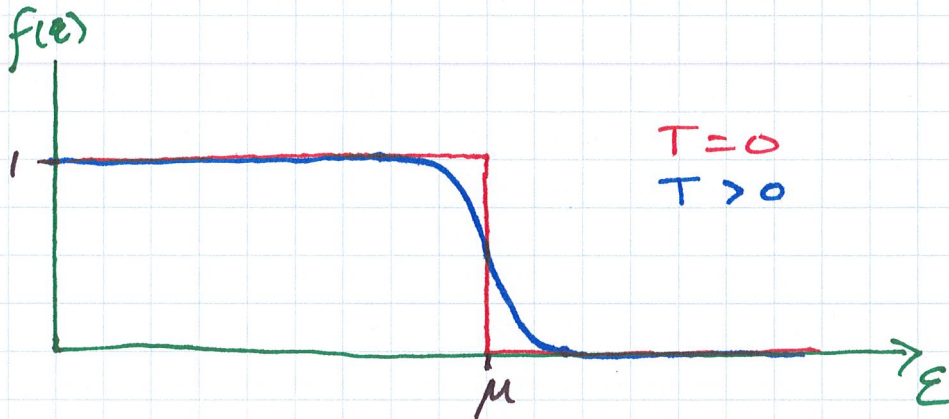

$$\times \frac{\partial}{\partial \mu} \left( 1 + \exp[(\mu - \epsilon_i)/k_B T] \right)_{V, T}$$

$$\langle N_i \rangle = \frac{1}{\exp[(\epsilon_i - \mu)/k_B T] + 1}$$

We can drop the index & write as a continuous function.

$$\langle N \rangle = f(\epsilon) = \frac{1}{\exp[(\epsilon - \mu)/k_B T] + 1}$$

↓  
Fermi-Dirac distribution

Previously :

$$@ T=0 \quad f(\epsilon) = \begin{cases} 1, & \epsilon < \epsilon_F \\ 0, & \epsilon > \epsilon_F \end{cases}$$

$$\therefore \lim_{T \rightarrow 0} \mu = \epsilon_F \quad \text{in general} \Rightarrow \mu = \mu(T)$$

$\epsilon_F = \mu$  is not strictly true @  $T > 0$ , but it is a good approximation even up to room temperature

Recall: chemical potential  $\mu_i = \left. \frac{\partial U}{\partial N_i} \right|_{S, V, N_j \neq i}$

is the energy cost to add/remove a particle to/from the system/ensemble.

What is the energy of this state @ finite T?

Same approach as T=0:

$$u = \frac{U}{V} = \frac{2}{V} \sum_{\mathbf{k}} \epsilon_{\mathbf{k}} f(\epsilon_{\mathbf{k}}) \rightarrow 2 \text{ e's per } \mathbf{k} (\uparrow \downarrow)$$

energy density  $\swarrow$   
 energy of state  $\mathbf{k}$   $\swarrow$   
 expected occupancy of state  $\mathbf{k}$  (FD-dist.)  $\swarrow$

using same trick:  $\frac{1}{V} \sum_{\mathbf{k}} F(\mathbf{k}) = \int \frac{d^3 \mathbf{k}}{8\pi^3} F(\mathbf{k})$

$$u = \int \frac{d^3 \mathbf{k}}{4\pi^3} \epsilon_{\mathbf{k}} f(\epsilon_{\mathbf{k}}) \rightarrow \text{both } \epsilon_{\mathbf{k}} \text{ \& } f(\epsilon_{\mathbf{k}}) \text{ are functions of } \mathbf{k}.$$

Note from the defn of DOS  $\Rightarrow D(\epsilon)$ ,  $u$  can be expressed as:

$$u = \int D(\epsilon) \epsilon f(\epsilon) d\epsilon$$

$\rightarrow$  drop  $\mathbf{k}$  label since  $\int d\epsilon$  now.

likewise:  $n = \frac{N}{V} = \frac{2}{V} \sum_{\mathbf{k}} f(\epsilon_{\mathbf{k}})$

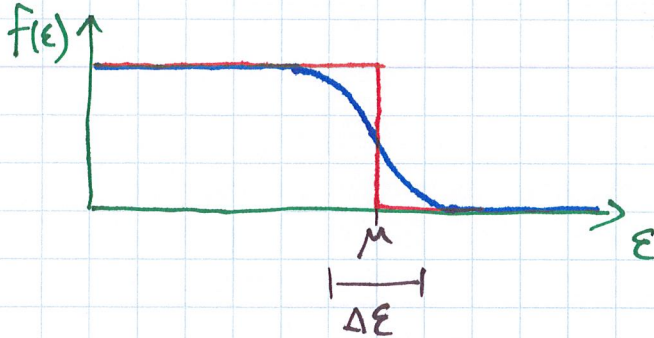

$$n = \int D(\epsilon) f(\epsilon) d\epsilon$$

Note:  $D(\epsilon) \propto \sqrt{\epsilon}$

These integrals have no closed form (try in your fav. solver).

and, in general,  $D(\epsilon)$  may be much more complicated than the  $\sqrt{\epsilon}$  form....

BUT

$f(T=0) \neq f(T>0)$  only differ by the small region around  $\epsilon = \mu$ .

$\therefore$  if  $T \ll T_F \Rightarrow$  check this condition for yourself.

We can approximate the integrals by the first couple terms of an expansion about  $\epsilon = \mu$ :

Sommerfeld Expansion:

for a function of  $\epsilon$ ,  $H(\epsilon)$ :

$$\int_0^{\infty} H(\epsilon) f(\epsilon) d\epsilon = \int_0^{\mu} H(\epsilon) d\epsilon + H'(\mu) \frac{\pi^2}{6} (k_B T)^2 + \mathcal{O}(k_B T)^4 + \dots$$

Back to  $u$  &  $n$ :  $D(\epsilon) = D(\epsilon_F) \sqrt{\frac{\epsilon}{\epsilon_F}}$

$$u = \frac{D(\epsilon_F)}{\sqrt{\epsilon_F}} \int \epsilon^{3/2} f(\epsilon) d\epsilon \quad \Rightarrow \quad H(\epsilon) = \epsilon^{3/2}$$

$$n = \frac{D(\epsilon_F)}{\sqrt{\epsilon_F}} \int \epsilon^{1/2} f(\epsilon) d\epsilon \quad \Rightarrow \quad H(\epsilon) = \epsilon^{1/2}$$

Apply S.E.:

$$u \approx \frac{D(\epsilon_F)}{\sqrt{\epsilon_F}} \left[ \int_0^{\mu} \epsilon^{3/2} d\epsilon + \frac{3}{2} \epsilon^{1/2} \Big|_{\mu} \frac{\pi^2}{6} (k_B T)^2 \right]$$

$$n \approx \frac{D(\epsilon_F)}{\sqrt{\epsilon_F}} \left[ \int_0^{\mu} \epsilon^{1/2} d\epsilon + \frac{1}{2} \epsilon^{-1/2} \Big|_{\mu} \frac{\pi^2}{6} (k_B T)^2 \right]$$

$$\therefore u \approx \frac{D(\epsilon_F)}{\sqrt{\epsilon_F}} \left[ \frac{2}{5} \mu^{5/2} + \frac{3}{2} \mu^{1/2} \frac{\pi^2}{6} (k_B T)^2 \right]$$

$$n \approx \frac{D(\epsilon_F)}{\sqrt{\epsilon_F}} \left[ \frac{2}{3} \mu^{3/2} + \frac{1}{2} \mu^{-1/2} \frac{\pi^2}{6} (k_B T)^2 \right]$$

Recall:  $D(\epsilon_F) = \frac{3}{2} \frac{n}{\epsilon_F}$  and  $n \neq n(T)$   
(constant volume).

$$\therefore n = \frac{3}{2} \frac{n}{\epsilon_F^{3/2}} \left[ \frac{2}{3} \mu^{3/2} + \frac{1}{2} \mu^{-1/2} \frac{\pi^2}{6} (k_B T)^2 \right]$$

$$\therefore \frac{2}{3} \epsilon_F^{3/2} = \frac{2}{3} \mu^{3/2} \left[ 1 + \frac{3}{4} \frac{\pi^2}{6} \left( \frac{k_B T}{\mu} \right)^2 \right]$$

$$\text{or } \mu = \epsilon_F \left[ \frac{1}{1 + \frac{3}{4} \frac{\pi^2}{6} \left( \frac{k_B T}{\mu} \right)^2} \right]^{2/3}$$

and  $\left( \frac{k_B T}{\mu} \right)^2 \approx \left( \frac{k_B T}{\epsilon_F} \right)^2$  assume  $\left( \frac{k_B T}{\mu} \right)^2 \ll 1$

$$\mu = \epsilon_F \left( 1 - \frac{2}{3} \frac{3}{4} \frac{\pi^2}{6} \left( \frac{k_B T}{\epsilon_F} \right)^2 \right)$$

$$\therefore \mu = \epsilon_F + \Delta\mu$$

where  $\frac{\Delta\mu}{\epsilon_F} \approx -\frac{\pi^2}{12} \left( \frac{k_B T}{\epsilon_F} \right)^2$

For  $T > 0$  but  $T \ll T_F$ ,  $\mu$  differs by  $\epsilon_F$  on the order of  $\left( \frac{k_B T}{\epsilon_F} \right)^2$  per (fractional)

$\rightarrow = \left( \frac{T}{T_F} \right)^2$

Recall:  $T_F \approx 10^5$  K

room temp:  $T \approx 3 \times 10^2$  K

$\Rightarrow$  large range of validity.

Likewise, we find:

$$u = u_0 + D(\epsilon_F) \frac{\pi^2}{6} (k_B T)^2 = u_0 - 3 \Delta \mu \eta$$

where  $u_0$  is the g.s. ( $T=0$ ) energy:  $u_0 = \frac{3}{5} \epsilon_F \eta$

### Heat capacity

→ Now very simple to calculate:

$$C_V = \frac{1}{V} \left. \frac{\partial U}{\partial T} \right|_V = \left. \frac{\partial u}{\partial T} \right|_V$$

$$\therefore C_V = D(\epsilon_F) \frac{\pi^2}{3} k_B^2 T \equiv \gamma T$$

$\gamma$  - Sommerfeld constant

$$\gamma = D(\epsilon_F) \frac{\pi^2}{3} k_B^2 = \frac{n \pi^2}{2 \epsilon_F} k_B^2$$

## Application of $v_0$ & $C_v$ to calculated parameters:

Mean free path:

$$l = v_0 \tau \approx v_F \tau$$

Thermal conductivity:

$$\frac{\kappa}{\sigma T} = \frac{1}{3} v_0^2 \tau C_v$$

$$\therefore \frac{\kappa}{\sigma T} = \frac{\pi^2}{3} \left( \frac{k_B}{e} \right)^2 \approx 2.4 \times 10^{-8} \text{ W} \cdot \Omega \cdot \text{K}^{-2}$$

good agreement w exp. (Table 1.6)

Thermopower:

$$Q = \frac{-\pi^2}{6} \frac{k_B}{e} \left( \frac{k_B T}{E_F} \right) \approx -1.42 \left( \frac{k_B T}{E_F} \right) \times 10^{-4} \frac{\text{V}}{\text{K}}$$

Much better agreement than Drude

$\Rightarrow$  smaller than Drude by  $\partial \left( \frac{k_B T}{E_F} \right) \approx 0.01$

@ room temp.
